Stress Less

When it's hot, it's hot and when it's cold it's real cold. That's just what you'll find here.

HotWave

Rheem, a leading global water heating and HVAC company, introduced HotWave™, the multipurpose hose sprayer that never runs out of hot water. Using tankless water heating technology to provide endless hot water outdoors, HotWave makes cleaning dirt and grime easier to help save users time and effort when washing their homes, patios, vehicles, pets and a variety of other items.

HotWave's plug-and-play design easily attaches and works with any garden hose. By incorporating tankless water heating technology, HotWave allows users to heat and access water from a single source. For users, this means eliminating the need to go indoors to get hot water outdoors. With a maximum temperature of 110 degrees, HotWave allows users to change their water temperature instantly to accommodate all their needs.

HotWave's multipurpose design features four spray patterns (cone, flat, jet and shower) that users can quickly and easily change by simply turning a dial. Each pattern offers a unique water pressure and the ability to use cool, warm, or hot settings. This allows users to customize the

spray for any and all of their personal needs. Because of this, HotWave makes cleaning dirt and grime easier, faster and more effective — saving time and effort when washing homes, patios, vehicles, and a variety of other items.

Furthermore, it features a comfortable, ergonomic grip and easy-to-use trigger lock to make cleaning a breeze.

3E System

When cattle are placed in a confined space, their instinct is to return to where they came from, or to find an open area they can escape to. By integrating 3E features that strategically use available light to guide cattle in the right direction, flow through the tub and alley system is enhanced.

The new 3E BudFlow® Cattle Tub is designed with panels that are sheeted lower than the rest. The first low-sheeted panel cattle see

upon entering the tub convinces cattle they are not entering an enclosed area, while the additional panel found by the exit guides cattle into the alley system easier and provides room for a hesitant cow to be overtaken by the next. For the 12 foot (ft.)-radius tub size, a second low-sheeted panel is placed across the wide curve to accommodate the larger size, keeping the same effect consistent and initiating the draw required for consistent flow.

The 3E System is incorporated into the new Easy Flow® Alleys through the new removable panels. Ranchers are now able to customize the sheet height of both sides of the alley to suit their operation, allowing them to control the amount of light and open space cattle see within the alleys.

Through the 3E features found in the Easy Flow Alleys and BudFlow Tubs, ranchers can easily manage cattle movement while keeping stress levels to a minimum for all animals and people involved.
