Sweat Victory

Fend off both weeds and sweat with this month's newest products.

DuraCor Herbicide

DuraCor™ features Rinskor™ active, the first new active ingredient for broadleaf weed control in pastures and rangeland.

“We are excited to bring this important new active ingredient to the range and pasture market,” says Jillian Schmiedt, Range & Pasture Category Lead at Corteva Agriscience.

Powered by Rinskor, recipient of the American Chemical Society's 2018 Green Chemistry Challenge Award, and teamed with long-proven and trusted aminopyralid, DuraCor controls more than 140 broadleaf weed species and offers several features, including:

- Safe to desirable forage grasses
- Extended broadleaf weed control
- Low use rate
- Compatibility with dry and liquid fertilizer
- Low-odor formulation
- Non-restricted use

“DuraCor brings together two actives that received reduced-risk status under the EPA's (Environmental Protection Agency) Conventional Reduced Risk Pesticide Program,” Schmiedt says. “Both are highly effective in controlling weeds yet give producers a product with a very favorable environmental profile.”

In addition to common rangeland and pasture weeds, such as thistles,

ragweed, horse nettle, pigweed and others, multiple years of testing show improved control of especially tough-to-control broadleaf species, including wild carrot, giant hogweed, wild parsnip, plantain, poison hemlock, the sunflower and aster families and common caraway. DuraCor also provides better control of mature marsh elder, Canada thistle, tall ironweed and others.

“In a year like we've just been through, when weather and other challenges prevent timely pasture spraying — or any spraying at all — producers will appreciate the wider application window with DuraCor,” Schmiedt adds.

Keeping weeds out of the way of pasture productivity is key as beef operations strive to manage costs by maximizing their grazing acres.

NoSweat

Playing sports, working hard on the job or just walking around town can lead to breaking out in a sweat that interferes with your activities. Getting sweat in your eyes or having it roll down your face can throw off your whole game, ruin your makeup and

is just generally annoying. NoSweat has created the first disposable performance liners for hats, helmets, hard hats and visors that absorb sweat instantly while preventing odors, stains and even acne.

NoSweat® thin liners simply peel and stick to the inside of headwear and feature SweatLock™ technology engineered to instantly absorb sweat. Moisture is locked inside the liner to help prevent dripping sweat, fogging, sweat stains, acne and odor. Each NoSweat liner absorbs around 2 ounces (oz.) of sweat.

The liners are performance, safety and hygiene based allowing users to perform at their best, without distractions that are associated with sweating. Depending on the person and activities being performed, each liner can last anywhere from one round of golf to two weeks of standard hat usage. The liners also preserve hats and keep the inside looking fresh.

NoSweat is a 100% American-Made company. NoSweat liners are available for hats, helmets, hardhats and visors and start at \$6.99 for a pack of three and \$34.99 for a pack of 25.
