

responders through several scenarios, imparting tips for understanding animal behavior. Frightened cattle running loose in the wake of an accident is one of the most common situations first-responders might face. Gill said animal panic is only worsened by sirens, flashing lights and a throng of yelling, arm-waving people. Sometimes one or more panicked animals ends up being shot when that scenario might have been avoided. Humans can be hurt or killed by panicked animals.

“Giving stressed animals some space and allowing them to calm down for 30 to 45 minutes is often the best approach,” advised Gill. “A crowd of people wanting to help, but not knowing how to do it, can be a big problem.”

Pate related an experience involving the rollover of a truck hauling fat cattle that occurred in a busy downtown area. Plenty of people wanted to do the right thing. Very few were, because it wasn’t a coordinated effort.

“One person needs to take charge and control the actions of people,” said Pate.

Among the recommendations offered by Pate and Gill were the following:

- ▶ Maintain a minimum distance and loose-herd animals while finding or creating a place for them to go.
- ▶ Portable panels often are brought in to contain loose animals. Make sure they are anchored as well as possible. Remember, once corralled, cattle are still capable of moving or tearing down the panels.
- ▶ Recognize the signs that an animal is going on the fight, including an elevated

head, erect ears, tightened jaw muscles and switching tail.

- ▶ Never step in front of a running animal. It probably won’t stop.
  - ▶ Try to work animals as a group rather than singly. A lone animal is more likely to panic and become dangerous.
  - ▶ Don’t direct car headlights or spotlights directly at animals as the lights could temporarily blind them.
  - ▶ Remember, human life and safety must take precedence over that of the cattle.
- Pate and Gill also demonstrated low-stress

stockmanship techniques for keeping animals calm while herding, penning or loading into a trailer.

J.K. Shearer, Iowa State University Extension veterinarian, talked about humane euthanasia of severely injured animals, describing the proper technique for using firearms or a captive bolt device.

## First BQA Producers’ Forum convened

Forum reviews history and goals of BQA Program and looks to the future of producer education within new committee structure.

The first-ever Beef Quality Assurance (BQA) Producer Forum was convened Feb. 5 during the 2014 Cattle Industry Convention in Nashville, Tenn. BQA is a nationally coordinated, state-implemented program that provides systematic information to U.S. beef producers and consumers about how scientific knowledge and commonsense husbandry practices can be applied to cattle production.

“BQA is not about regulation. We provide education and guidelines,” said Oklahoma veterinarian Bob Smith, a member of the national BQA Advisory Board.

“We are outcome-based,” added Smith. “It’s interesting that foreign countries that try to regulate every step of production don’t have outcomes as good as here, in this country.”

Fellow veterinarians and advisory board members Dee Griffin of Nebraska and John Maas of California also helped review the history and goals of BQA. They explained how BQA has evolved into a program of sound, science-based production practices

aimed at improving consumer satisfaction and confidence, and enhancing marketing opportunities for beef. Proactive producers trained and certified in BQA keep detailed records to assure that their management and husbandry practices meet regulatory and industry standards.

Much of the forum’s question-and-answer session focused on how cattle feeders can respond if beef packers call for audits of suppliers. Griffin said BQA feedlot-assessment guidelines could be obtained from state BQA coordinators or accessed through [www.bqa.org](http://www.bqa.org), and third-party assessments may be conducted by local veterinarians or state cattle association and university personnel.

In response to questions about this hastily scheduled forum, John Maas, who chairs the BQA Advisory Board, explained that it was created in the wake of National Cattlemen’s Beef Association (NCBA) committee restructuring and elimination of the Joint Producer Education Committee.

“I think that committee was valuable, and others seem to think so too,” Maas said, encouraging producers in agreement to get involved trying to “reinvent” an avenue by which producers readily provide input, not just to the BQA program, but to all producer education efforts.
